## Medical Screenings

Breast cancer screening (ABUS), bone density screening, uterine cancer screening, ovary check-up (AMH, FSH), bridal check-up

## About Infertility Treatment

We always do everything possible at our clinic to provide infertility treatment tailored to each patient, based on the latest therapeutic information. We are committed to providing the best medical care for each and every patient, to those who are new to infertility treatment, and to those who are feeling anxious or currently undergoing treatment. In addition to “general infertility,” the main infertility treatment we propose is “infertility treatment for patients with premature ovarian insufficiency (POI),” which includes “in vitro activation of primordial follicles (IVA)” and “intra-ovarian infusion of platelet rich plasma treatment (PRP).” We offer infertility treatments that are tailored to each and every patient taking their lifestyle into consideration. In addition, we have a counseling system for addressing the concerns of our patients in the course of their examination.

### Counseling

Many patients experience various psychological as well as physical stresses when undergoing infertility treatment. Patients at our clinic receive individual consultations with a clinical psychologist and reproductive psychology counselor to address their concerns and help them feel at ease as they undergo therapy. Patients at other clinics may also request counseling, so please feel free to contact us.

## About General Gynecology

A woman’s body is highly complex and intricate. Female hormones continually cause various changes in the body and this also affects mental and physical balance. The Gynecology section mainly examines and treats symptoms and illnesses that occur during the process of physical changes in the body caused by female hormones. General gynecology treats premenstrual symptoms (PMS), menstrual pain and other menstruation-related concerns, and illnesses occurring in the female organs. The Gynecology section also performs gynecological screenings (uterine cancer screening, breast cancer screening, bridal check-ups, ovarian function check-ups, and bone density screening) in addition to examining and treating abnormal abdominal pain and urination, menopausal disorders, and osteoporosis associated with menopause. Uterine fibroids, ovarian cysts, endometriosis, and other conditions are often accompanied by menstrual and abdominal pain. It is important to check for gynecological illnesses when a patient experiences such symptoms. We make every effort to provide an environment that makes it easy for patients to talk by offering exams and treatment by women physicians to address concerns about illnesses specific to women that women find hard to discuss. Please feel free to consult us about your own physical condition so we can provide quick and accurate diagnosis and treatment of the health issues mentioned above.

### Vitamin Injections and Supplements

We offer injections that are beneficial for recovering from fatigue and have cosmetic benefits for patients at every stage of their life, to help them maintain their beauty and health. We also provide supplements that we have developed and selected at our clinic. We encourage all patients and their families to try them to maintain health.
